

Management Reports

End-of-cycle operational summary for management review and decision-making.

Management reading

This report package contains two management reports generated from the Housekeeping task log and room-status board. The first identifies operational pressure by status and location. The second ranks staff workload to support fair task allocation.

Data source: readable text records from rooms.txt and housekeeping_tasks.txt. Snapshot generated on 2026-08-15.

Room Status and Task Priority

A filtered operational view of every active housekeeping task, enriched with room location and then ordered by urgency: Dirty, Cleaning, Inspected, Ready.

Task ID	Room	Floor	Staff	Task Type	Current Status
HK1002	R102	1	HK002	DEEP CLEAN	Dirty
HK1001	R101	1	HK000	CHECKOUT CLEAN	Cleaning

Report algorithm

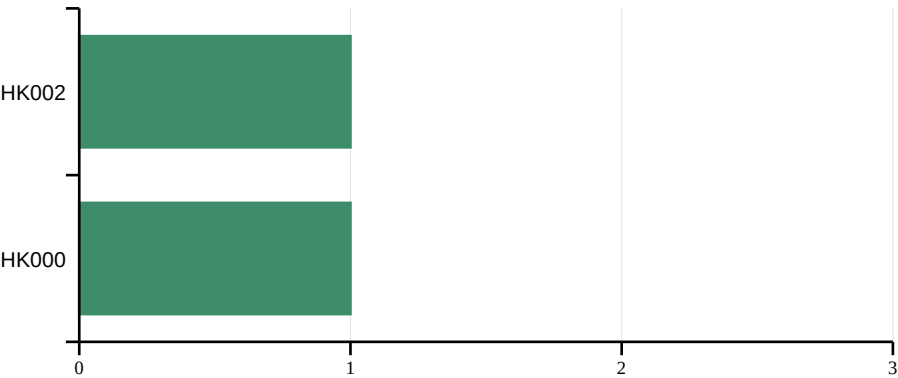

Search each task by room number to enrich it with floor details; filter to active tasks; sort the result first by operational status and then room number. Management can use this ordered list to direct staff toward Dirty and Cleaning rooms first.

Decision focus: rooms at Dirty or Cleaning stages require immediate operational attention before new check-in demand is accepted.

Staff Workload and Completion Risk

A workload summary that searches task assignments, filters out completed-ready tasks, and ranks staff by active task count.

Open task workload by assigned staff

Rank	Staff ID	Assigned Tasks	Pending Tasks	Operational Note
1	HK000	1	1	Within normal range
2	HK002	1	1	Within normal range

Report algorithm

Search the sequential task log by assigned staff ID; filter tasks whose room status is not Ready for Check-In; sort staff in descending workload order, retaining alphabetical order for ties. This makes staffing imbalances visible at a glance.

Management action: redistribute assignments when a staff member accumulates several pending tasks while others have spare capacity.
